

Factors influencing population health status	Regulatory response
<b>Global influences:</b> upon context, place and behaviour	← Global health governance
<b>Context:</b> ecological variables: economic, environmental, social and cultural influences	← Strategic interventions within social and economic systems and processes
<b>Place:</b> local environment, workplace, housing, transport	← Strategic interventions within local environments and specific settings
<b>Behaviours:</b> eg diet, nutrition, smoking and physical exercise	← Targeted, selective and/or universal prevention strategies centred around behavioural change
<b>Health care interventions:</b> clinical health care settings are an important setting for prevention and management	← Provider-based interventions: selective (primary) prevention following diagnosis of risk factors; targeted (secondary) prevention following diagnosis of illness
<b>Biophysiological factors and health outcomes:</b> biological processes causing and manifesting states of health and illness	← Clinical interventions: medical treatment
